

ANSKINO QUARRY PRODUCTS

Anskino LLC extracts sand and gravel materials from the title quarry located in Palkino District of the Pskov Region, 50 km from Pskov. The manufacturing capacity of the equipment used allows for extraction of 15000 m³ of gravel chippings of various fractions per month. At the warehouse, there are always reserves of gravel chippings of different fractions ready to be dispatched. The fractional mechanical strength of the gravel extracted is 600-800, which makes it possible for the material to be used in manufacture of concrete items, construction and repairs of motorways.

Another field for Anskino Company is marketing another natural material — pebbles. Pebbles are loose fragments of diverse rocks, worn and rolled by waves and glaciers over a long time. Pebbles vary in sizes, with diameters ranging from 1 to 10 centimeters, and brag endless variations and combinations of color. With their simplicity and tolerance to environmental factors, pebbles make for a great material for construction, creating original indoors and outdoors décor, or laying out private courtyards.
