

FOUNDATION BLOCKS

FBS foundation blocks are concrete items designed to distribute and transfer the load of the entire building upon its foundation. The FBS-grade foundation blocks are strong, moisture-resistant and fireproof.

The FBS-grade foundation blocks are compressing concrete items receiving the load of the entire structure and transferring it onto the foundation pad.

The FBS-grade blocks are characterized by three geometric parameters: length, width and height, each strictly defined in GOST 13579-78.
