

## FENCING ELEMENTS

Concrete slab fencing is used to enclose industrial and construction sites, storage terminals etc.

Concrete slab fencing is used to enclose industrial and construction sites, storage terminals etc. Concrete fences and walls are strong and highly resistant to ambient elements (frost, snow, rain, temperature extremes), as well as easy to assemble. Installation of concrete walls does not require building a foundation, and can be performed directly on site.

The concrete fence consists of two primary elements: the concrete slab (a rectangular concrete slab with special fixture studs) and the conical foundation block with a four-facet installation aperture in the top part (the socket).

When storing the concrete fencing elements, it is recommended to use timber separators. These separators must be of uniform thickness, placed between the elements vertically one above the other. Furthermore, the height of such a stack should not exceed two meters. When transported, the stack height is defined by the bearing capacity and dimensions of the vehicle.
